

ARTIOM GUTU

Junior Cloud and Automation Engineer | Python, AWS and Reliable Systems

Wolverhampton, United Kingdom | +44 7561447187 | gutu.artiom444@gmail.com | github.com/Pepstee

PROFILE

First-Class Computer Science graduate focused on cloud automation, dependable software workflows and systems that fail safely. My university work investigated anomaly detection within AWS Lambda environments, while my current projects cover structured data, validation, testing, resumable execution and auditable automation. I am looking for an entry-level role where I can deepen practical cloud and infrastructure engineering skills.

TECHNICAL FOCUS

- Python automation, structured JSON data, SQLite, APIs and deterministic validation.
- AWS Lambda and CloudWatch telemetry through the SCAFAD dissertation project.
- GitHub-based software projects, automated tests, retries, caching, resumability and audit trails.
- Security-conscious design, privacy, adversarial testing and fail-closed operational controls.

SELECTED PROJECTS

SCAFAD | First-Class Computer Science dissertation

AWS Lambda, CloudWatch telemetry, Python and anomaly detection

- Investigated anomaly detection within AWS Lambda environments using serverless telemetry.
- Worked across telemetry collection, graph-based analysis, privacy, adversarial testing, explainability and research evaluation.
- This was an undergraduate research and engineering project, not professional production-security employment.

Market Aligner | Job-intelligence and automation system

Python workflow, SQLite persistence, validation and resumability

- Directed AI agents implementing collectors, validation, caching, SQLite persistence, retries and resumability.
- Defined the product requirements and evidence boundaries, then tested and reviewed the resulting system.
- I do not present the AI-generated implementation as code that I personally hand-wrote.

Multi-agent software factory | Reliable AI-assisted delivery

System architecture, operational control, testing and evaluation

- Own the requirements, system architecture, operation, evaluation and acceptance decisions.
- Designed bounded workflows around planning, implementation, independent review, certification and recovery.
- AI agents generated substantial implementation code; my role is accurately described as architecture, direction, operation and acceptance.

EDUCATION

BSc (Hons) Computer Science, First-Class Honours

Birmingham Newman University | Graduated 2 July 2026

Final-year dissertation: SCAFAD, investigating anomaly detection within AWS Lambda environments using serverless telemetry.

ADDITIONAL EXPERIENCE

- Paid online English tutoring, requiring clear explanation and adaptation to individual learners.
- Customer-facing direct sales in Birmingham, including recruitment, training or coaching of new starters; this was not a B2B role.

Evidence boundary: project implementation used substantial AI-generated code under my direction. Claims in this CV are limited to the operator-approved evidence record.
